

Biodiversity, Transformation and Socially Meaningful Innovation

Sybille van den Hove
Median, Barcelona

Prologue: there is a crisis...

or is it just one crisis?

- ❑ Financial /Economic
- ❑ Social/Demographic
- ❑ Energy
- ❑ Climate change
- ❑ Biodiversity and ecosystems
- ❑ Water
- ❑ Contamination: chemical and radioactive
- ❑ New forms of contamination (e.g. nanotechs?...)

A series of systemic crises

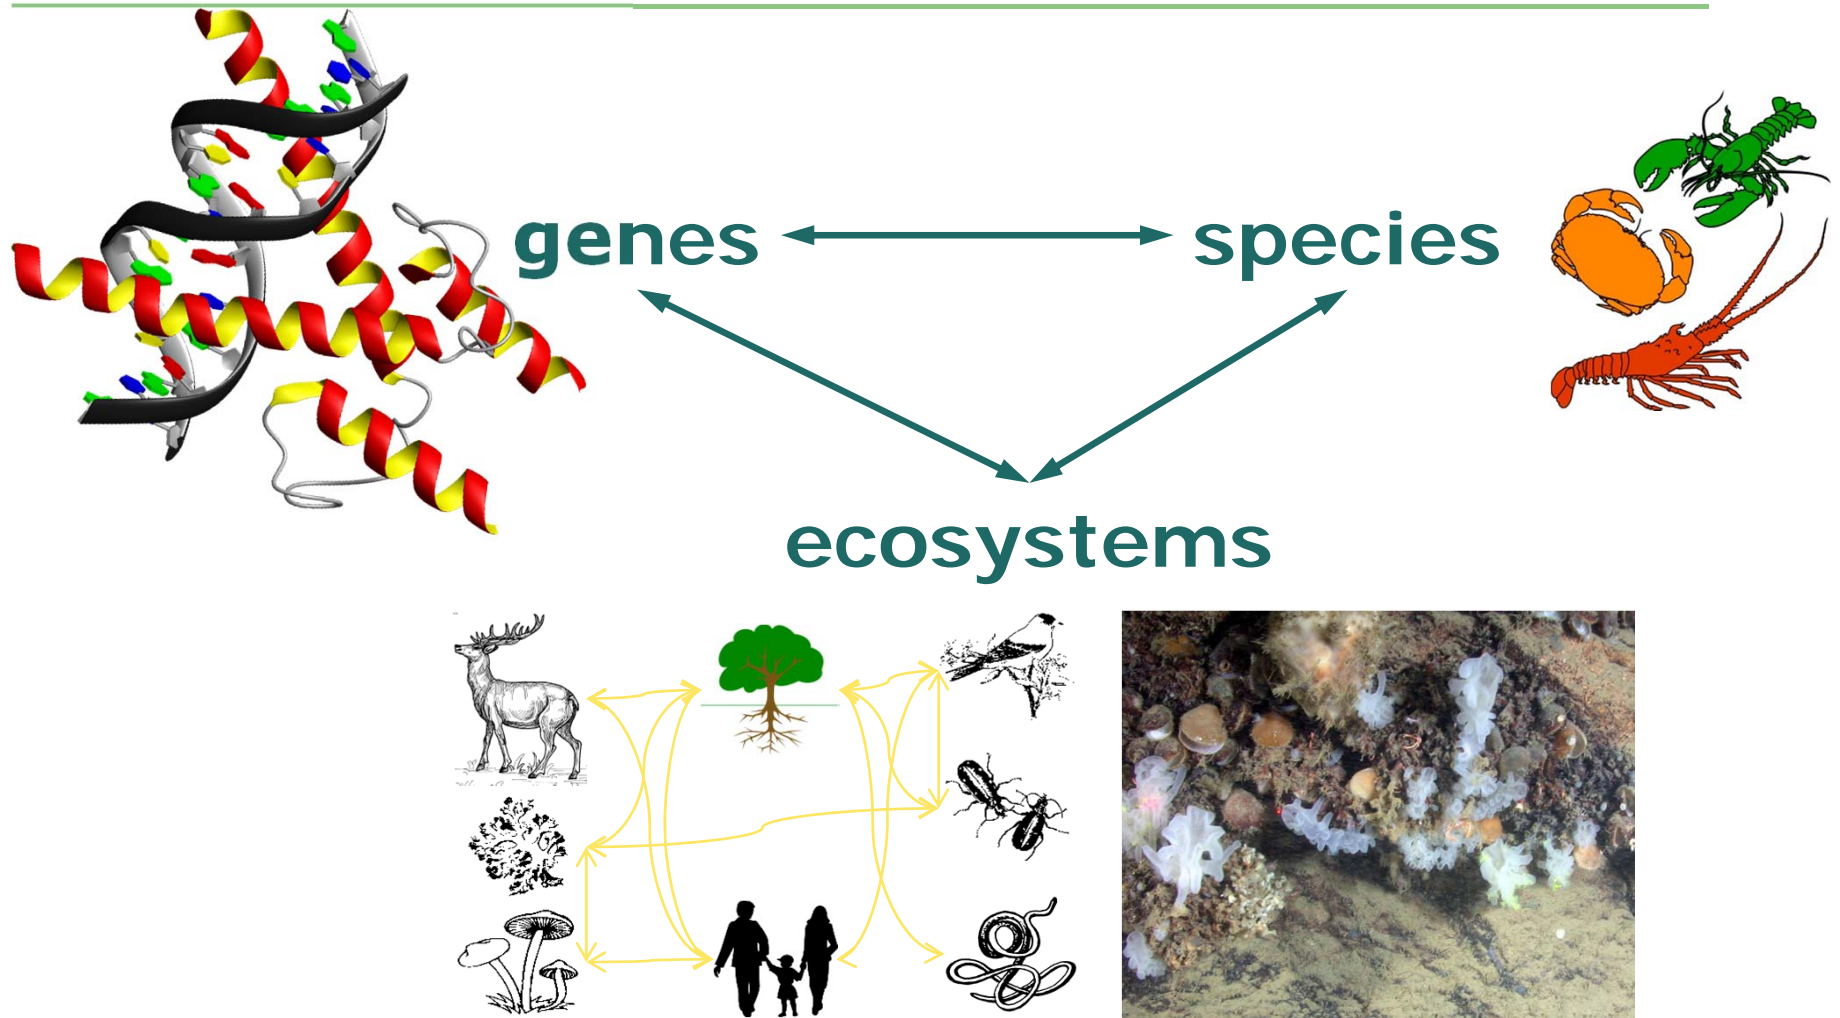

Global
environmental
crisis

Content

- ❑ The biodiversity crisis
- ❑ Comparing the crises: commonalities, differences
- ❑ Interconnectedness
- ❑ Biodiversity at the heart of the picture
- ❑ Time for transformation
- ❑ Innovation
- ❑ Why business

Biodiversity

The biodiversity crisis

We are losing species, genes, populations, ecosystems at accelerating rates (species: 1000x higher rate than natural rate)

Drivers of biodiversity loss / change

- ❑ lifestyles
- ❑ production and consumption patterns
- ❑ population growth
- ❑ economic growth
- ❑ conflicts
- ❑ land- and sea-use changes
- ❑ climate change, ocean acidification,
- ❑ over-exploitation of natural resources
- ❑ Pollution
- ❑ invasive species
- ❑ soil erosion
- ❑ ...

Direct drivers growing in intensity

		Habitat change	Climate change	Invasive species	Over-exploitation	Pollution (nitrogen, phosphorus)
Forest	Boreal	↗	↑	↗	→	↑
	Temperate	↘	↑	↑	→	↑
	Tropical	↑	↑	↑	↗	↑
Dryland	Temperate grassland	↗	↑	→	→	↑
	Mediterranean	↗	↑	↑	→	↑
	Tropical grassland and savanna	↗	↑	↑	→	↑
	Desert	→	↑	→	→	↑
Inland water		↑	↑	↑	→	↑
Coastal		↗	↑	↗	↗	↑
Marine		↑	↑	→	↗	↑
Island		→	↑	→	→	↑
Mountain		→	↑	→	→	↑
Polar		↗	↑	→	↗	↑

Most direct drivers of degradation in ecosystem services remain constant or are growing in intensity in most ecosystems

Driver's impact on biodiversity over the last century

Low	Low
Moderate	Moderate
High	High
Very high	Very high

Driver's current trends

Decreasing impact	↘
Continuing impact	→
Increasing impact	↗
Very rapid increase of the impact	↑

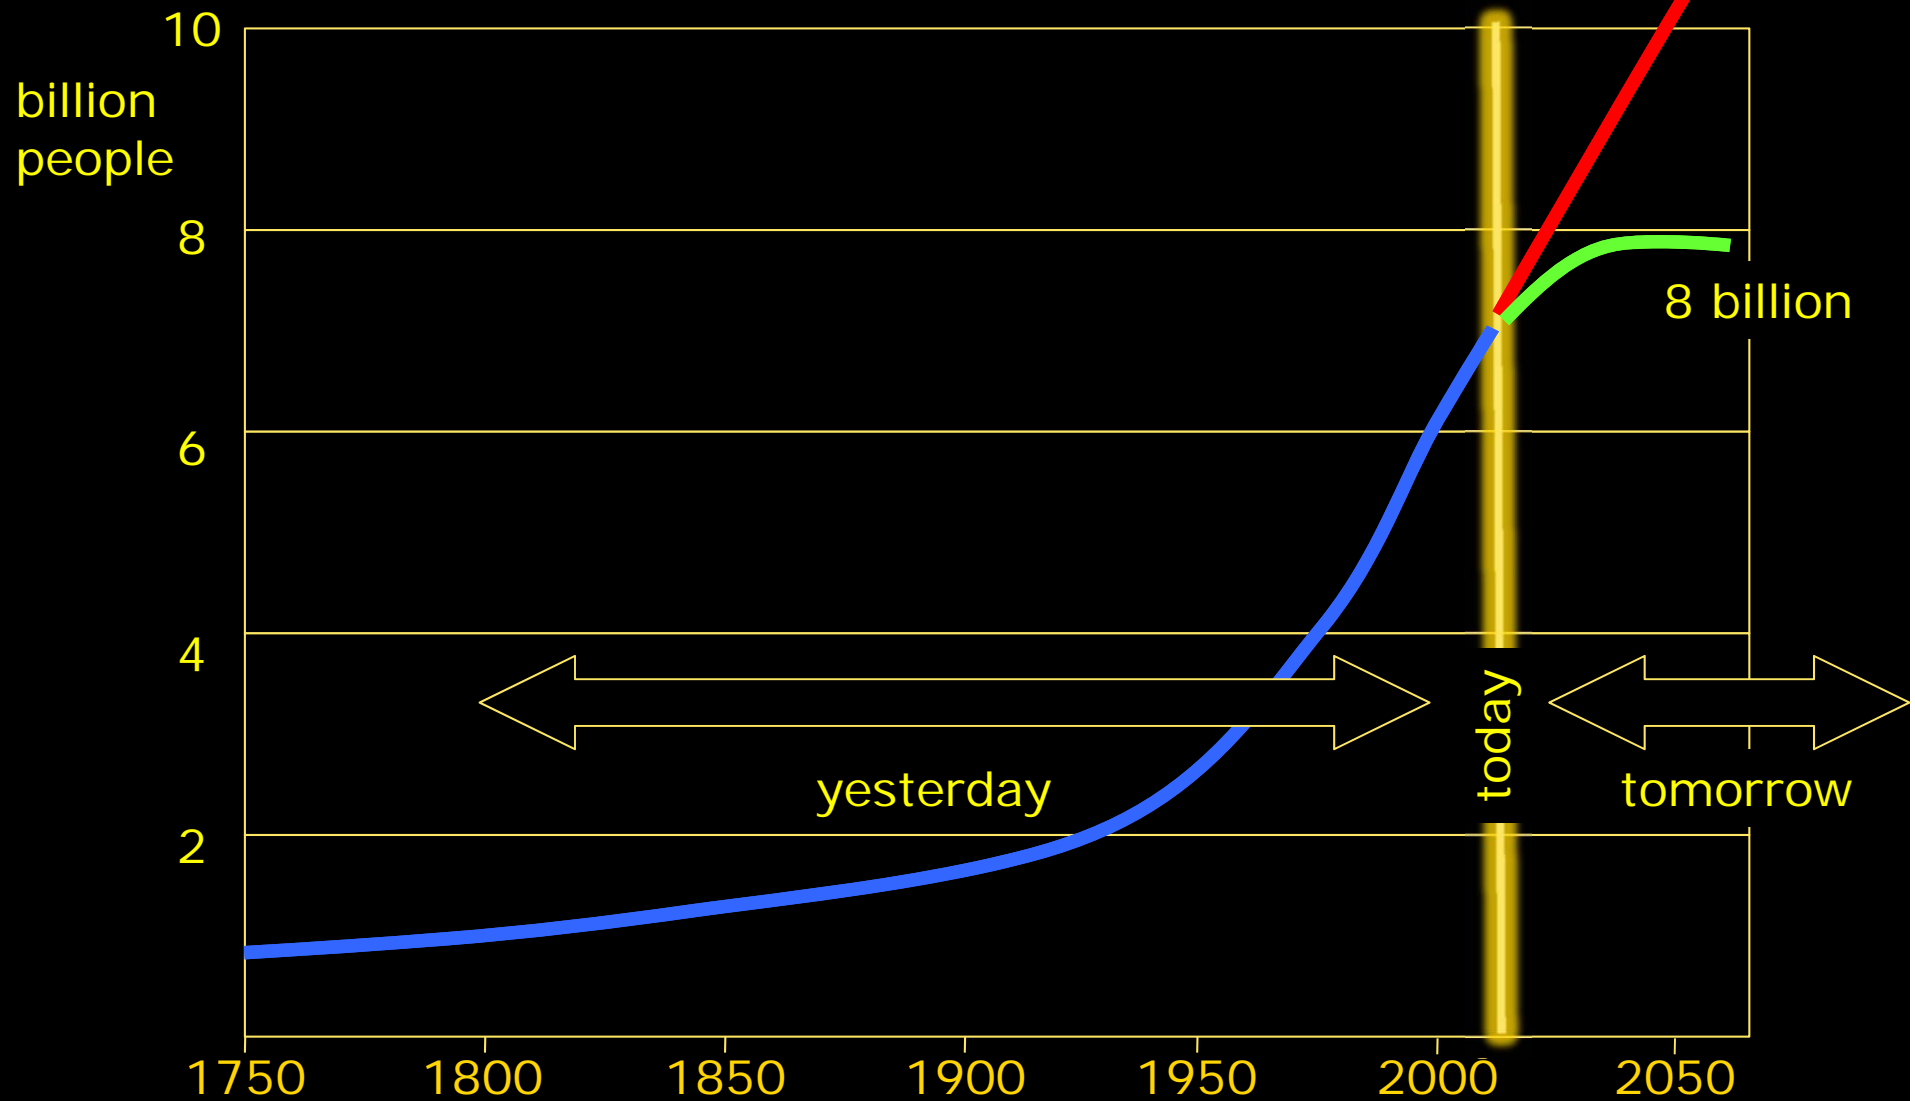

Source: Millennium Ecosystem Assessment

Millennium Ecosystem Assessment, 2005

The living world...

- Gives us
 - oxygen, food, fibre, medicine, fuel, ...
- Ensures that
 - water and air are pure, plants are pollinated, seed are dispersed, pest and disease controlled, ...
- Helps to
 - dispose of waste, recycle nutrients, regulate floods, absorb carbon, regulate climate, ...
- Allows us to be human, giving us
 - inspiration, recreation, well-being, discovery, ...
- Provides options for the future
 - choice for future generations, buffer against the unexpected, ...

Population projections

HUMAN POPULATION GROWTH CHART

(including projections)

Consumption growth since '65:

- total energy 284%
- oil 268%
- gas 435%

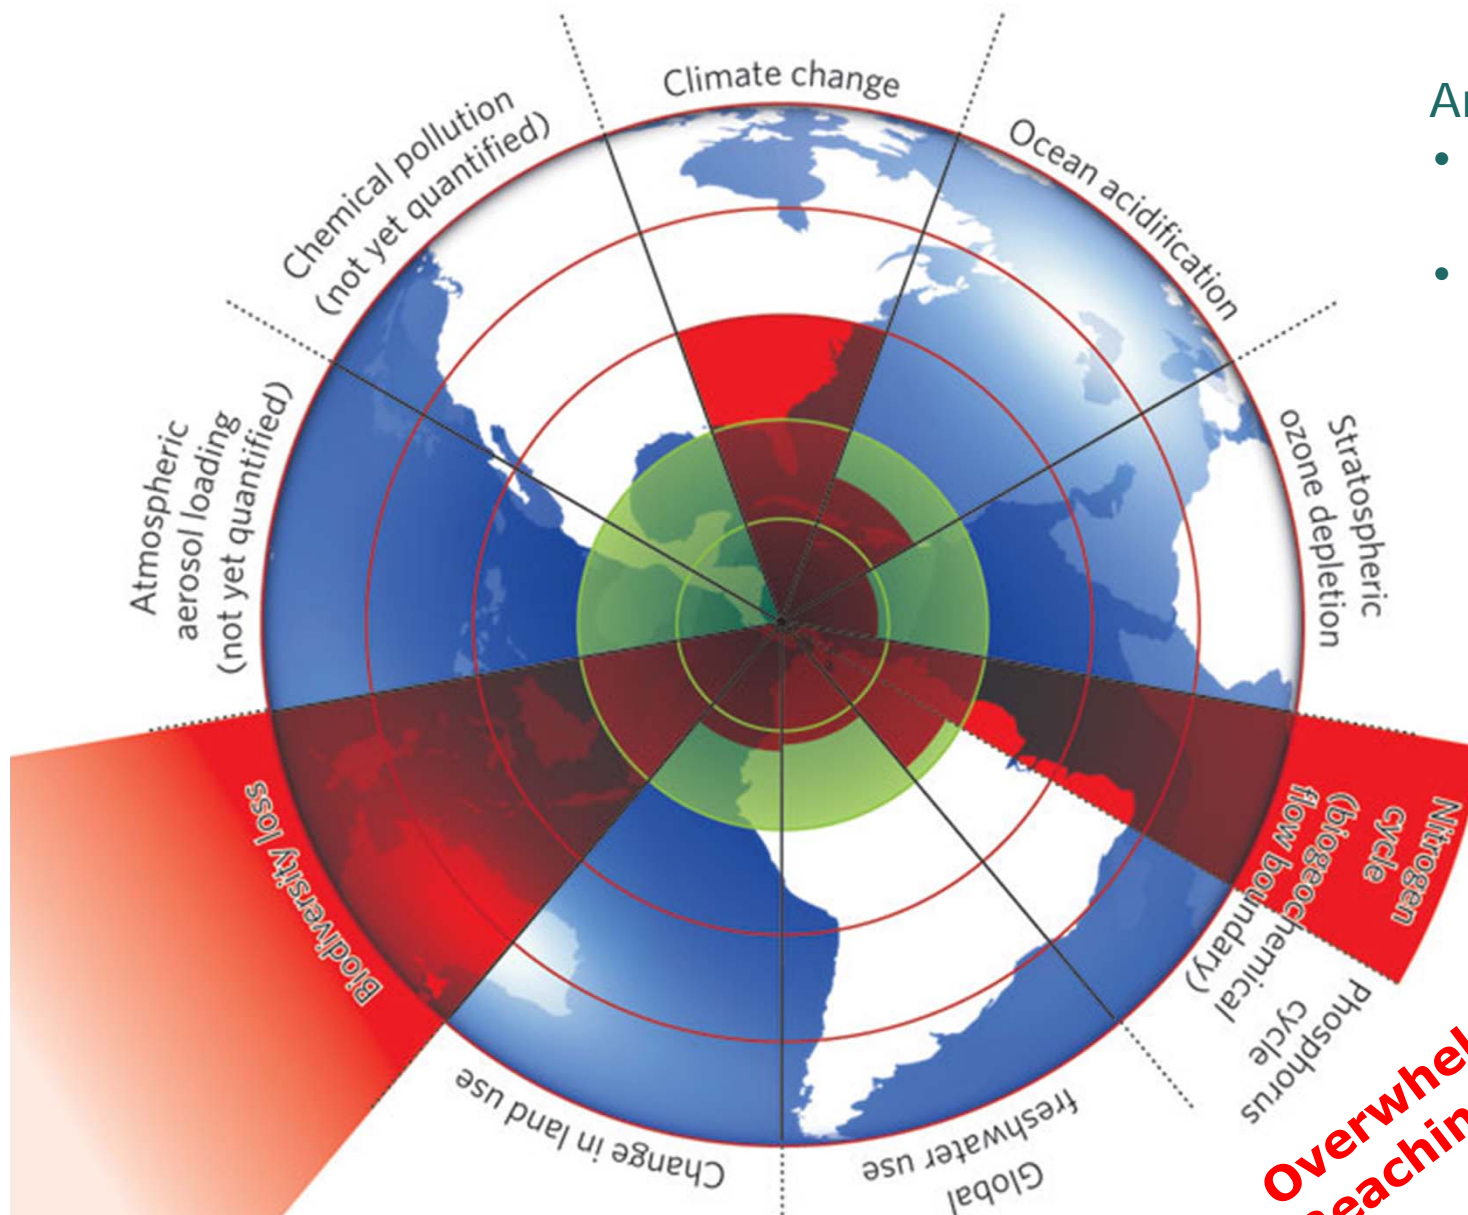

The living world must supply the clean water, all food, (most of the) energy and many other services to all these people

Environmental issues... (crises)

And...

- Radioactive pollution
- New forms of contamination (GMOs, nanotechs?...)

Rockström et al. 2009 "A safe operating space for humanity"

**Overwhelming the system?
Reaching ecological limits?**

Comparing 3 crises

Sea Ice Extent
09/09/2011

National Snow and Ice Data Center, Boulder, CO

median
1979–2000

Some common underlying causes

1. Ignorance of complex system, e.g. thresholds, tipping points and systemic risks
2. Early warnings & late lessons ignored
3. Misplaced faith in models
4. Strong imbalances between stocks and flows
5. Debts and risks passed on to distant others incl. future generations
6. Misleading market prices that exclude many costs and risks
7. Non-transparent transactions, products and impacts
8. Socially malign incentives
9. Not accounting for what matters
10. Dominance of free market deregulatory ideology

Some common & pervasive consequences

- ❑ Capitals (financial, economic, social, natural) destroyed
- ❑ Inequities and injustices exacerbated
- ❑ Environmental, social & economic insecurities increased
- ❑ Meltdown in trust in financial, political and business elites
- ❑ Economic & political ideological vacuums created
- ❑ **Opportunities now for radical ideas and practices? (and risks!)**

Some key differences...

- Financial and energy systems are (hu)manmade... the biosphere is not
- Financial crisis is visible, short term, largely reversible ...
Climate and biodiversity crises are to a large degree not (yet) visible, longer term, mostly irreversible
- Financial systems are more volatile: perceptions, expectations & behaviour rapidly change the system dynamics
- **All societies and economies depend on ecosystems, not vice-versa!**

Have we looked at things the wrong way?

A different take on sustainability:

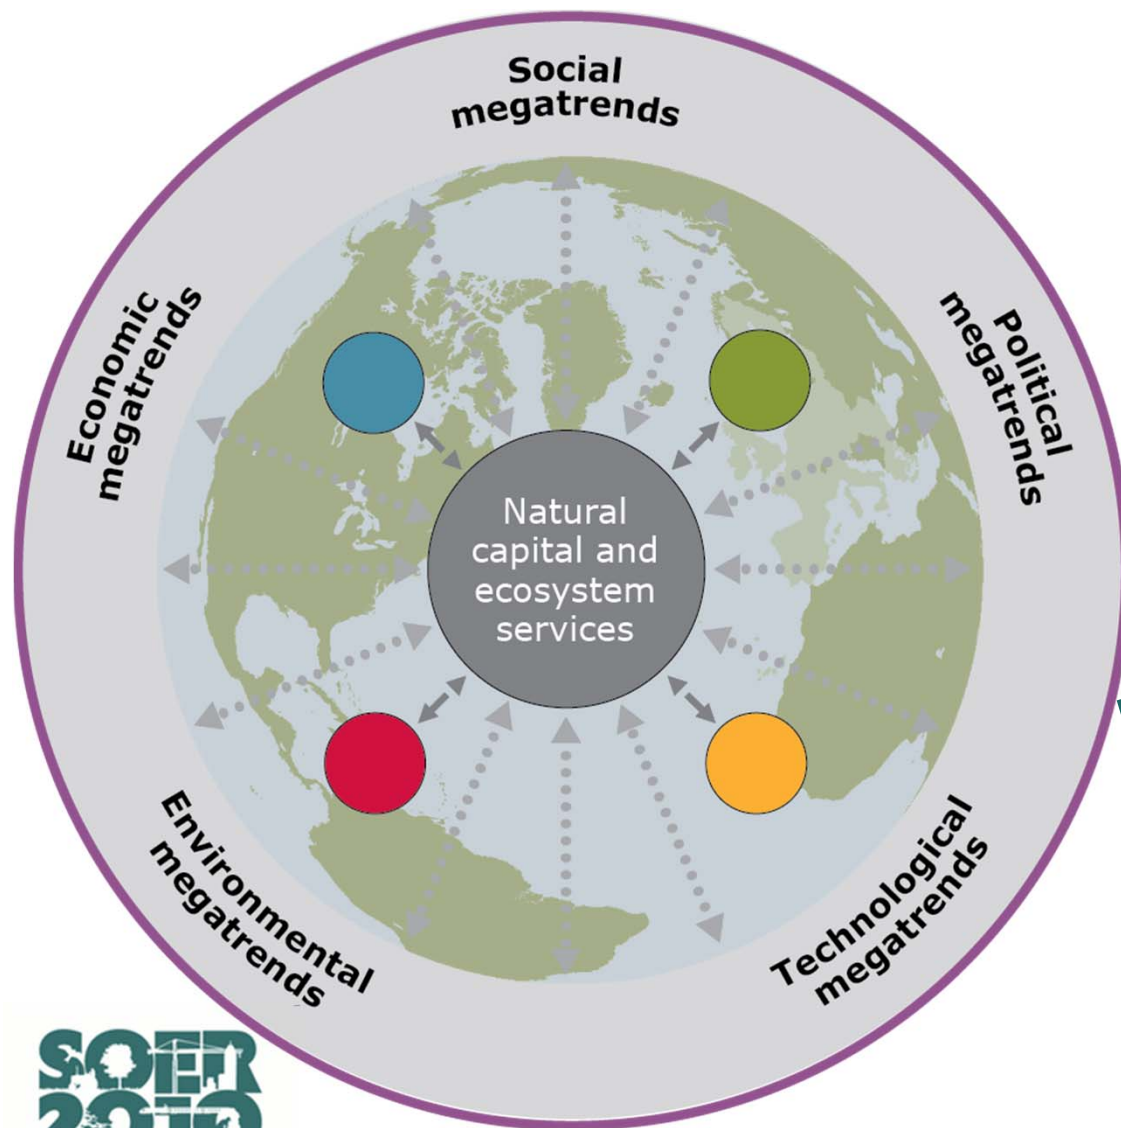

René Passet

Any civilisation is ultimately dependent on its ecological foundations

Interconnectedness

- ❑ A complex landscape of interconnected environmental and societal challenges:
 - poverty; food security; population; water; health; biodiversity; energy; climate change; chemical contamination; ocean acidification,...
- ❑ Interconnections between systems, risks, crises
- ❑ Biodiversity:
 - ✓ reveals interconnectedness
 - ✓ offers an interesting way to think about the other crises

Placing biodiversity and ecosystems at the heart of the issue landscape

Because we are living beings and it is our inescapable life-support system!

Environment policy priority areas

- Climate change
- Nature and biodiversity
- Natural resources and waste
- Environment, health and quality of life

European Environment Agency

Time for transformation

- ❑ Current system builds on irreversible destruction of non-substitutable natural capital \Rightarrow environmental destruction as an unavoidable side-effect ...
- ❑ Often our environmental policies and strategies are case-by-case “end-of-pipe” add-ons to an unchanged system ...
- ❑ More than mitigation and adaptation capacities is needed: **transformative capacity**

“The ability to fundamentally alter the nature of the system over the long term, when current ecological, social, or economic conditions become untenable or are undesirable” (T. Elmqvist)

Innovation

- ❑ Dominance of a **narrow concept of innovation** as a way to bring more products to markets and deliver economic growth, jobs, profits in the short term

VS.

- ❑ **Concentrating on human health, wellbeing and quality of life**, and embarking on a more ecologically, socially and economically sustainable path

Re-balancing market-focussed innovation and socially meaningful and responsible innovation

Innovation with a human purpose!

Innovation: a transformative tool

Transform how we feel, think, relate to others and to nature, create, live, act, ... and **do business!**

Some old ways won't work...

A role for business

- ❑ The time is ripe for a new business model
- ❑ Business can be reinvented to make more sense:
 - Business to provide a service to society
 - While maintaining our ecological life-support system
 - We can avoid the confusion of means and ends
- ❑ Some ingredients:
 - Innovation with a human purpose
 - Accepting fears, doubts and the feeling of helplessness
 - Values and ethics
 - Enthusiasm and optimism
 - Creativity and dreams
 - Harmony
 - Humour

**Always take the
time to nurture
these!**

Thank you!

Also for inspiration many thanks to Marc Le Menestrel, Julian Rodes, EEA SOER 2010 team, David Gee, Jacquie McGlade, Michael Depledge, Pierre Mottet, Martin Sharman, René Passet, Thomas Elmqvist, Calvin & Hobbes, and many others...
